Background

During the 2013 survey for the N6 Galway City Transport Project, habitats were mapped at a number of locations in or near the townland of Ballygarraun, north of the city. These were locations where limestone pavement had previously been identified by R. Goodwillie. This work constituted part of Stage 3 in Perrin *et al.* (2013). No constraints (e.g. bad weather, restricted access) were encountered during the survey. In total, six relevés (plots for quantitative vegetation cover data) were recorded in Annex I habitats at these locations. Due to the abrupt curtailment of the 2013 survey project, no assessment of these habitats or relevés was made in Perrin *et al.* (2013). They are assessed in this short report using the standard parameters for Annex I habitats of area, structure and functions and future prospects. Each of these parameters is addressed in turn and then combined to form an overall assessment.

Annex I habitats

Three Annex I habitats were recorded in the Ballygarraun area: 4060 Alpine and Boreal heaths, 6210 Semi-natural dry grasslands and scrubland facies on calcareous substrates (Festuco-Brometalia), and *8240 Limestone pavement (Table 1). These habitats are shown in Figure 1. Habitat 4060, which was represented by the lowland *Dryas octopetala* community, covered only a few square metres and was not assessed.

Area

This parameter assesses whether there have been any recent losses in habitat extent. An examination of Google Maps remote imagery from 2003-2012 indicates that there has been no significant change in either of the two Annex I habitats assessed, habitat *8240 and habitat 6210. They are therefore assessed as *Favourable*.

Structure and functions

This parameter assesses the condition of the habitats. Six relevés were recorded, two in habitat 6210 and four in habitat *8240. The locations of these relevés are shown in Figure 2. Full details of these relevés are included in Appendix 1. Habitat 6210 was assessed using the criteria of O'Neill *et al.* (2013). Habitat *8240 was assessed using the criteria of Wilson & Fernández (2013); all *8240 relevés were recorded on exposed limestone pavement. Relevés passed or failed depending on whether they achieved the relevant target for each criterion (e.g., number of indicator species, sward height). One of the 6210 relevés and two of the *8240 relevés passed the assessment (Table 2), both thus only achieving a 50% pass rate, which gives an assessment of *Unfavourable – Bad*. Scrub encroachment appears to be an issue in areas of *8240 habitat.

Future prospects

This parameter assesses impacts on the habitats and whether the long-term viability of the habitats is assured. Impacts on these Annex I habitats are assessed in Table 3 using the standard codes of Ssymank (2011). The most eastern of the locations surveyed in this area, near Brockagh, is very lightly grazed, mostly by horses. Habitat *8240 occurs here, and scrub is encroaching on the small areas of exposed limestone pavement. The location east of the Roadstone quarry, at Two Mile Ditch, has both Annex I habitats *8240 and 6210, and is grazed by cattle, which access both the open and wooded areas. There is some suggestion of impact from grazing on sward composition in the grassland patches here. The locations northwest of the quarry, at Ballygarraun, are divided by stone walls. The area to the north here appears to be grazed by cattle, whilst the area to the south is

grazed by a donkey. There is scrub and bracken encroachment on the limestone pavement in the latter area. Future prospects for habitat 6210 were assessed as *Favourable*, while habitat *8240 was assessed as *Unfavourable – Inadequate* due to scrub encroachment.

Overall assessment

The overall assessments are presented in Table 4. It is important to note that an overall assessment of *Unfavourable – Bad* does not imply that the habitat is of low conservation value, but that it is in need of improved management.

Table 1. Area (ha) of Annex I habitats in the Ballygarraun area divided into relevant habitat categories of Fossitt (2000).

Annex I Habitat	Fossitt habitat category						Total
	HH4 Montane heath	ER2 Exposed calcareous rock	GS1 Dry calcareous and neutral grassland	WN2 Oak-ash- hazel woodland	WS1 Scrub	WN2/WS1 Oak-ash- hazel woodland/ Scrub	
4060	<0.01	0.00	0.00	0.00	0.00	0.00	<0.01
6210	0.00	0.00	0.27	0.00	0.00	0.00	0.27
